Designer™ Furniture Layout Software Continues To Evolve

Dallas, TX— Middle Atlantic Products new Designer™ industry-leading layout design software package has recently been updated to provide more options when designing the company's VisionFrame™ Video walls.

The Designer software is now capable of designing unlimited VisionFrame layouts more accurately by providing unlimited width capability and automatically adding uprights as needed, instead of having to add multiple walls for each design. Measurements now go up to 169" in height and provide more accurate upright and horizontal beam placement.

Designer was created to accompany Middle Atlantic's visionary new line of technical furniture, the Viewpoint™ Console System. This free program for console design and room layout features simple, intuitive use that incorporates many common operating system commands.

Designer software allows users to quickly and easily create a ViewPoint console, desk or VisionFrame video wall layout with high-quality graphics, providing a realistic depiction of the environment being designed. Middle Atlantic partnered with a number of users in the software's development stages to create a platform with valuable and practical functionality.

Features include a full color console and room design, ergonomic Line-of-sight tool for ideal operator placement, the ability to export to AutoCAD® in both 2D and 3D, the option to add notes and labels to the design and automatic updates that ensure the software is always up to date.

As a sales proposal tool, Designer™ software will also prepare a full retail quote and detailed design specification. It is currently available as a free download from middleatlantic.com.
