Middle Atlantic Introduces Industry's First Hardwired Rackmount UPS System

Orlando, FL — Middle Atlantic Products announced the addition of a hardwired rackmount UPS to its family of UPS systems that provides a code-compliant, cost-effective solution for seamlessly distributing battery backup power both inside and outside the rack. The first of its kind to offer hardwired input and output connections, this new UPS minimizes the chance of inadvertent or malicious disconnection making it ideal for critical applications subject to high security including casinos, prisons and banks, or any environment where uptime is critical.

The new hardwired UPS also provides a code compliant solution for extending UPS backed power outside the rack, and allows an installer to securely terminate remote hardwired branch circuits directly to the UPS without requiring a transition box, saving time and money on the purchase and installation of extra materials.

Hardwired UPS models include those that provide hardwired input and hardwired output connections, as well as models that provide corded input and hardwired output connections. All new hardwired UPS systems feature additional local output receptacles.

Middle Atlantic supports the UPS line with an industry-leading 3-year warranty program. For more information on the entire family of Middle Atlantic UPS products, click to middleatlantic.com.
