Middle Atlantic Debuts UPS With Individual Outlet Control

Fairfield, NJ—Middle Atlantic Products is introducing a new line of UPS systems that provide true individual outlet control, both remotely via RS-232 and IP, and locally using Middle Atlantic Power Manager™, a web-based interface for local monitoring and control.

The first UPS with 100% individual outlet control in the Commercial AV and Residential markets, this system allows users to control each of the 8 outlets independently, unlike other systems that only support control of outlet groups.

This capability allows users to restrict unauthorized use of outlets for additional security, and when integrated with a control system via RS-232, can support up to 8-stage sequencing in any combination, with any delay; no separate sequencer is necessary.

The Middle Atlantic Products UPS also features Pure Sine Wave technology, integration with AV control systems and a unique sliding rear rackrail mount that provides the AV industry's first single-person UPS mounting capability. The easy installation functionality of the UPS simplifies rack integration in residences, theaters, stadiums, boardrooms and other AV environments.

The UPS system ensures the highest levels of uninterrupted AV equipment performance: In the event of a power outage or extreme over/under voltage occurrence, the system's AVR capability ensures a continuous 120V output and the Pure Sine Wave technology minimizes harmonic distortion and line noise. The fast 4-millisecond transfer time ensures that connected equipment stays online, with no lock-ups.

Middle Atlantic supports the UPS line with an industry-leading 3-year warranty program. For more information on the entire family of Middle Atlantic UPS products, click to middleatlantic.com.
